

MOBILEvario

Fare Management and Clearing System

MOBILEvario delivers a powerful, multi-client-capable back office system offering transport companies complete control over their sales processes. This state-of-the-art solution supports classic paper tickets, smart cards, barcodes, mobile tickets, and ID/account-based fare collection, as well as modern open payment media.

Due to the sophisticated customer management, additional functions and modules such as ID-based ticketing, postpaid, prepaid, and season ticket systems can be easily handled.

The open system architecture facilitates the integration of additional sales channels, clients and different ticket media based on open Application Programming Interfaces (APIs) and web services. These interfaces make it very easy to integrate third-party systems or any existing infrastructure.

For passengers, MOBILEvario allows for the real-time calculation of fares, providing remaining account balances so riders can better manage their fare accounts, and offers fare capping and best price fare options so they never have to worry about paying too much for a ticket.
